SUMMARY

Final-year B.Tech (CS-AI) student and blockchain/GenAI engineer with a year of paid engineering experience. Builds systems where correctness is enforced structurally rather than assumed: an agentic-payments control plane that keeps LLMs out of the authorization path, a regulated fractional real-estate platform, and an Ethereum-anchored evidence chain. Google Summer of Code 2024 contributor.

EXPERIENCE

• SupeAI

July 2025 – July 2026

Blockchain & GenAI Engineer (Intern)

Kochi, India

- Sole developer of **Assetize**, a blockchain-anchored fractional commercial real-estate investment platform (Next.js 16, TypeScript, Prisma 7, Supabase Postgres, Polygon): 16 data models, ~24 API routes and 58 commits, backed by ~3,900 lines of self-authored architecture documentation.
- Enforced a strict Repository → Service → API layering so a planned migration to on-chain Solidity contracts touches only the data layer; a self-run architecture audit caught and refactored 3 boundary violations.
- Designed a pre-seeded pool of real Polygon Avey transactions so every on-chain record an investor clicks resolves on a public block explorer with zero network latency during a live pitch.
- Stored all currency as integer paise to eliminate float error, and root-caused 14 logged defects, including a distribution bug that omitted the 9% management fee and would have overpaid every investor.

• Nuevoue

March 2024 – May 2024

AI Developer

Remote

- Built n8n-based workflow automations and custom AI chatbots for client companies at an early-stage startup founded within the college.

PROJECTS

• Praman - Agentic Commerce Control Plane

Razorpay AI Buildathon 2026

TypeScript, PostgreSQL, Prisma, Ed25519, MCP, Razorpay SDK, Vitest

[Adwaith-R-Nair / Praman](#)

- Removed the language model from the authorization path entirely: an agent's purchase intent carries only a SKU and quantity and *has no price field*, so a compromised merchant page cannot influence the amount charged.
- Built an append-only, hash-chained ledger whose immutability is enforced by a Postgres trigger rather than application convention; available spend is derived by replaying the ledger from genesis, never stored as a mutable balance.
- Measured the defense instead of asserting it: 100% policy containment at 0% false-refusal rate, and money moved in 0 of 21 runs even where prompt injection successfully fooled the model.
- Delivered solo in 9 days: 142 single-purpose commits, ~8,800 lines of TypeScript across 9 packages, with a 24-entry architecture decision log.

• Honora - Blockchain Evidence Management System

4-person team

Solidity 0.8.24, Hardhat, ethers.js v6, Node/Express/TS, MongoDB, IPFS

[Adwaith-R-Nair / Honora](#)

- Owned the blockchain and backend layers: authored EvidenceRegistry.sol (on-chain role enum, gas-efficient custom-error reverts, append-only custody chain, global duplicate-hash prevention) and deployed it verified on Ethereum Sepolia.
- Designed dual-layer RBAC: a fast Express middleware check returns a cheap 403, while Solidity modifiers remain the authoritative gate, so an application-layer bypass still cannot act on-chain.
- Decoupled semantic indexing behind fire-and-forget calls so evidence upload, custody transfer and SHA-256 integrity verification never depend on a non-critical service being available.

• Nexus - Multi-Provider CLI AI Agent

Solo

Bun, TypeScript, Commander.js, Anthropic/Gemini/OpenAI/Ollama APIs

[Adwaith-R-Nair / Nexus-TUI](#)

- Unified four LLM providers behind one provider-agnostic interface, implementing three independent agentic tool-use loops directly against each vendor's REST API without an agent SDK.
- Centralized a human-in-the-loop safety layer that displays the exact file write or shell command and requires confirmation before execution, with a 5-iteration cap to prevent runaway tool loops.

ACHIEVEMENTS

- **Google Summer of Code 2024:** Selected contributor, Oppia Foundation.
- **Top 100, MLH Global Hack Week 2024:** Recognized globally for open-source contributions across Hack Week challenges.
- **Hackathons:** 2nd Place, Guvi Hackathon | 4th Place, SparkX Hackathon (MEC) | Round 2 Qualifier, Adobe University Hackathon 2026.

EDUCATION

• Muthoot Institute of Technology and Science

2023 – 2027

B.Tech in Computer Science and Artificial Intelligence | CGPA: 8.5 / 10

Kochi, Kerala

- Class XII, CBSE, 99% (St. Antony's Public School, Kottayam) | Class X, CBSE, 99.2% (Kendriya Vidyalaya Ernakulam)

SKILLS

- **Languages:** TypeScript, JavaScript, Python, Solidity, Java, C++, C, SQL
- **Web & Backend:** React, Next.js, Node.js, Express, FastAPI, Tailwind CSS, Prisma, MongoDB, PostgreSQL, Supabase, REST APIs
- **Blockchain:** Ethereum, Solidity, Hardhat, ethers.js, Web3.js, Polygon, IPFS/Pinata, Solana, smart-contract access control, cryptographic hashing
- **AI & Agents:** LLM tool-use & agent design, Model Context Protocol (MCP), RAG, vector databases (Qdrant, ChromaDB), prompt-injection defense, IBM watsonx, Ollama, PyTorch, TensorFlow, Scikit-learn, NumPy, Pandas
- **Tools & Infrastructure:** Git, GitHub Actions, Docker, AWS, Vercel, Cloudflare, Vitest, pnpm | *Exploring:* Rust, Kubernetes
- **Certification:** NxtWave CCBP 4.0 Fellow (AI, ML, Full-Stack)
